

INFO3068: Activity F04 PHP Sessions

Fall 2022

Purpose

This exercise is intended to build a rough framework of a web application that uses sessions in PHP.

Instructions

Construct the following PHP pages. Include your initials in each of the file names. For example, if your initials are DT then loginXX.php would be loginDT.php.

1. **loginXX.php:** A login page that accepts username and password. If there is form input, assume that the userid and password are correct. Save the userid in session. We're not ready to connect to a database yet. Then, redirect the user to the main menu page.
2. **menuXX.php:** A main menu page that display's the user's userid. If userid is not present in session, that is the user hasn't logged in, then redirect the user to the loginXX.php page. This menu page should also have a link to logout page
3. **logoutXX.php:** This page should start the session and then destroy the session. Include a link back to loginXX.php to allow the user to log back in if they wish.

Upload the 3 .php files and a screen shot of the output of menuXX.php from your browser.
